AUTHORED FIXTURE LECTURE 1: RELATIONS AND KEYS
A relational table has rows with named attributes.
A primary key uniquely identifies a row and cannot be null.
A foreign key references a key in another or the same table.
Student(id, name) can use id as its primary key.
Enrollment(student_id, course_id) references Student.id.
A student may enroll in several courses, so student_id can repeat.
A composite key (student_id, course_id) can identify an enrollment
when each student enrolls in a given course at most once.
