AUTHORED FIXTURE LECTURE 2: SQL JOINS
An INNER JOIN returns matching row combinations.
A LEFT JOIN also preserves unmatched rows from its left table.
Unmatched right-side columns contain NULL in those rows.
Ada has enrollments DB and AI; Lin has no enrollment.
A left join from Student to Enrollment returns three rows:
(Ada, DB), (Ada, AI), and (Lin, NULL).
A WHERE filter requiring e.course_id = DB can remove Lin.
Normalization is outside this lecture and requires another source.
